

**Fluid Mechanics and Rate Processes: Fluid Statics Tutorial: August 04, 2016**(Questions are adopted from Chap 2, Fluid Mechanics, F. M. White, 7<sup>th</sup> Ed.)

**P2.41.** In Fig. P 2.41 both the tank and the tube are open to the atmosphere. If  $L = 2.13$  m, what is the angle of tilt  $\theta$  of the tube?

**P 2.41**

**P2.47.** Very small pressure differences  $P_A - P_B$  can be measured accurately by the two-fluid differential manometer in Fig. P2.47. Density  $\rho_2$  is only slightly larger than that of the upper fluid  $\rho_1$ . Derive an expression for the proportionality between  $h$  and  $P_A - P_B$  if the reservoirs are very large.

**P 2.47**

**P2.63.** The tank in Fig. P2.63 is 2 m wide into the paper. Neglecting atmospheric pressure, find the resultant hydrostatic force on panel  $BC$  (a) from a single formula and (b) by computing horizontal and vertical forces separately, in the spirit of Section 2.6.

P 2.63

**P2.71.** Gate  $ABC$  in Fig. P2.71 has a fixed hinge line at  $B$  and is 2 m wide into the paper. The gate will open at  $A$  to release water if the water depth is high enough. Compute the depth  $h$  for which the gate will begin to open.

P 2.71
